**PAN 1998-492066**

**Patentee details** (FUIT ) FUJITSU LTD;( FUIT )

**Abstract** JP-10215283 A; The system has a node number memory (101) which stored node number of almost in a communication network at predetermined numerical order. When the **restart** of an auto node is performed, then the following small node number and large node number next to the auto node number are searched from the node number memory. The **restart notification** containing the direction of descending order of **notification** relay and **restart** generation node number is produced. A **restart notification** start unit (102) transmits **restart notification** for the node having small node number and next large node number. The call is released when the **restart notification** forwarded from other nodes is received by the **restart** generation node. A **restart notification** relay unit (103) performs relay of **restart notification** to following small node or next large node according to direction of **notification** relay designated by received **restart notification**.
